Some Random Landscape Thoughts

Healthy soils can be hard to come by whether a result of erosion, foot traffic, constant annuals, or poor planting. This common problem can be fixed by using our food waste also known as composting. In fact if food waste were a country, it would be the third largest emitter of greenhouse gas emissions. The average American family throws away \$1,600 worth of produce every year!

Why not put that waste to work and start composting? There are a range of different sizes, prices, and functionalities, the best part is anyone can compost food scraps and turn it into rich compost that is great for the garden. Even if you're in an apartment or small house, a Bokashi compost bin would work great. Larger homes can use a cedar compost bin or a compost tumbler. Plants will thrive from the nutrients composting will bring.
